About

- **SubScruple** is a free, web-based application focused on letting users manage their personal subscriptions for a variety of services and was developed and managed by BBS teemMaets.

- The user is able to enact different actions while using this application, such as:

  - View a multitude of services listed by the application.

  - Adding subscriptions to their own profile

  - Viewing all their subscriptions and a running total for how much they spend monthly/yearly.

  - Editing their profile.

  - Checking notifications which, depending on the user's respective location, they would receive notifications about newly available services or different deals their services are currently offering.

Lessons Learned

- Over the course of the semester, we learned quite a few key things to keep in mind when developing this application as a group. Some of these things include but are not limited to:

  - Make clear the objectives and functionalities of the application by keeping the development within the scope of your original brainstorm. If not, alter your original goals to fit your new ideas. Not having a set plan over the course of a project could potentially give one developers block.

  - Depending your development knowledge and the time frame of your project, be ambitious with your goals, but also be realistic by not setting impractical goals for yourself.

  - Definitely refer to the software requirements specification and software design document whenever you're unsure of how certain areas of your application function.

  - Within the remaining time from this presentation up until the due date of the third project milestone, we'll possibly be implementing new features, but mainly dedicate our time to resolving interface/functionality bugs.

Any Questions?
